

NietoCity: Getting Started

Created by Nieto Software, 16 September 2026

1. What is in the starter zip

- CLAUDE.md: the condensed rules Claude Code reads on every run.
- TASKS.md: the pinned Phase 1 task list with checkboxes.
- README.md, LICENSE (GPLv3), THIRD_PARTY.md: licence compliance from the first commit.
- .gitignore: Gradle, Android Studio, keystore and Claude Code local files excluded.
- PHASE1_PROMPT.md: the Phase 1 prompt as plain text so you can copy it without retyping.

2. Steps

1. Unzip NietoCity_starter_files.zip into your empty project folder so the files sit at the top level, not in a subfolder. Confirm you can see CLAUDE.md next to LICENSE.
2. Open GitHub Desktop, choose Add local repository, select the folder, and let it initialise. Publish it as a public repository named NietoCity (public is required by the GPL once you distribute builds).
3. Open a terminal in the folder (right-click, Open in Terminal, or use the Android Studio terminal) and run:

```
claude
```

4. Paste the whole of PHASE1_PROMPT.md as the first message. Claude Code will work through the eight tasks and commit after each one.
5. When it stops, review the summary, run the APK on the S22 (USB debugging on, then "gradlew installDebug") and run the desktop JAR with "java -jar desktop\build\libs\desktop.jar".
6. Push with GitHub Desktop. Send me the Phase 1 summary and anything that failed, and I will write Phase 2.

3. If something goes wrong

- Build fails on Java version: tell Claude Code to investigate and report the cause first; the prompt already allows a JDK 17 toolchain download.
- Antivirus blocks Gradle downloads: the work desktop (ESET) was fine; on the laptop, allow the .gradle folder if Avast interferes.
- MicropolisJ fetch fails: the network may block GitHub; download the repository zip in a browser and place it in a tools folder, then tell Claude Code where it is.
